# Reading and writing files

## Package/Method Description

```
Syntax: r (reading) w (writing) a (appending) + (updating: read/write) b (binary, otherwise text)
                 Different
                 modes to
                                1. 1
File opening
                 open files
modes
                                1. Examples: with open("data.txt", "r") as file: content = file.read() print(content
                 for specific
                 operations.
                               Copied!
                              Syntax:
                                1. 1
                                2. 2
                                3. 3
                                1. file.readlines() # reads all lines as a list
                                readline() # reads the next line as a string
                                3. file.read() # reads the entire file content as a string
                 Different
                               Copied!
                 methods to
File reading
                 read file
                              Example:
methods
                 content in
                 various
                                1. 1
                 ways.
                                2. 2
                                3. 3
                                4. 4
                                1. with open("data.txt", "r") as file:
                                        lines = file.readlines()
                                2.
                                3.
                                        next_line = file.readline()
                                4.
                                        content = file.read()
                               Copied!
                              Syntax:
                                1. 1
                                2. 2
                                1. file.write(content) # writes a string to the file
                                2. file.writelines(lines) # writes a list of strings to the file
                 Different
                               Copied!
                 write
File writing
                 methods to
                              Example:
methods
                 write
                 content to a
                                1. 1
                 file.
                                2. 2
                                1. lines = ["Hello\n", "World\n"]
                                2. with open("output.txt", "w") as file:
                                        file.writelines(lines)
                               Copied!
                              Syntax:
                                1. 1
                                1. for line in file: # Code to process each line
                 Iterates
                               Copied!
                 through
                 each line in
Iterating over
                              Example:
                 the file
lines
                 using a
                                1. 1
                 'loop'.
                                2. 2
                                1. with open("data.txt", "r") as file:
                                2. for line in file: print(line)
```

```
Syntax:
                                1. 1
                                2. 2
                 Opens a
                                1. file = open(filename, mode) # Code that uses the file
                                2. file.close()
                 file,
                 performs
                               Copied!
                 operations,
Open() and
                 and
                              Example:
close()
                 explicitly
                 closes the
                                1. 1
                 file using
                                2. 2
                 the close()
                                3. 3
                 method.
                                1. file = open("data.txt", "r")
                                2. content = file.read()
                                3. file.close()
                               Copied!
                              Syntax:
                                1. 1
                                1. with open(filename, mode) as file: # Code that uses the file
                 Opens a file
                 using a with | Copied!
                 block,
with open()
                 ensuring
                              Example:
                 automatic
                                1. 1
                 file closure
                                2. 2
                 after usage.
                                1. with open("data.txt", "r") as file:
                                2. content = file.read()
                               Copied!
Pandas
Package/Method Description
                                                                Syntax and Code Example
                 Reads data
                 from a `.CSV` Syntax: dataframe name = pd.read csv("filename.csv") Example: df =
.read csv()
                 file and creates pd.read csv("data.csv")
                 a DataFrame.
                                Syntax:
                                   1. 1
                                   1. dataframe_name = pd.read_excel("filename.xlsx")
                 Reads data
                                 Copied!
                 from an Excel
.read excel()
                 file and creates Example:
                 a DataFrame.
                                   1. 1
                                   1. df = pd.read_excel("data.xlsx")
                                 Copied!
                                Syntax:
                                   1. 1

    dataframe_name.to_csv("output.csv", index=False)

                                 Copied!
                 Writes
                 DataFrame to
.to csv()
                                Example:
                 a CSV file.
                                   1. df.to_csv("output.csv", index=False)
                                 Copied!
```

```
Syntax:
                                   1. 1
                                   2. 2
                                   1. dataframe_name["column_name"] # Accesses single column
                                   2. dataframe_name[["column1", "column2"]] # Accesses multiple columns
                 Accesses a
                                 Copied!
                 specific
Access Columns column using
                                Example:
                 [] in the
                 DataFrame.
                                   1. 1
                                   2. 2

    df["age"]

                                   2. df[["name", "age"]]
                                 Copied!
                                Syntax:
                                   1. 1

    dataframe_name.describe()

                 Generates
                 statistics
                                 Copied!
                 summary of
describe()
                 numeric
                                Example:
                 columns in the
                 DataFrame.
                                   1. 1
                                   1. df.describe()
                                 Copied!
                                Syntax:
                                   1. 1
                                   2. 2
                 Removes
                                   1. dataframe_name.drop(["column1", "column2"], axis=1, inplace=True)
                 specified rows
                                   2. dataframe_name.drop(index=[row1, row2], axis=0, inplace=True)
                 or columns
                 from the
                                 Copied!
                 DataFrame.
drop()
                 axis=1
                                Example:
                 indicates
                 columns.
                                   1. 1
2. 2
                 axis=0
                 indicates rows.
                                   1. df.drop(["age", "salary"], axis=1, inplace=True) # Will drop columns
                                   2. df.drop(index=[5, 10], axis=0, inplace=True) # Will drop rows
                                 Copied!
                                Syntax:
                 Removes rows
                                   1. dataframe_name.dropna(axis=0, inplace=True)
                 with missing
                 NaN values
                                 Copied!
dropna()
                 from the
                                Example:
                 DataFrame.
                 axis=0
                                   1. 1
                 indicates rows.

    df.dropna(axis=0, inplace=True)

                                 Copied!
duplicated()
                 Duplicate or
                                Syntax:
                 repetitive
                                   1. 1
                 values or
                 records within

    dataframe_name.duplicated()

                 a data set.
                                  Copied!
```

```
Example:
                                   1. 1
                                   1. duplicate_rows = df[df.duplicated()]
                                 Copied!
                                 Syntax:
                                   1. 1
                                   1. filtered_df = dataframe_name[(Conditional_statements)]
                 Creates a new
                                 Copied!
                 DataFrame
Filter Rows
                 with rows that
                 meet specified Example:
                 conditions.
                                   1. 1
                                   1. filtered_df = df[(df["age"] > 30) & (df["salary"] < 50000)</pre>
                                 Copied!
                                 Syntax:
                 Splits a
                                   1. 1
                 DataFrame
                                   2. 2
                 into groups
                 based on

    grouped = dataframe_name.groupby(by, axis=0, level=None, as_index=True,

                 specified
                                   sort=True, group_keys=True, squeeze=False, observed=False, dropna=True)
                 criteria,
                                 Copied!
groupby()
                 enabling
                 subsequent
                                 Example:
                 aggregation,
                 transformation,
                                   1. 1
                 or analysis
                 within each
                                   1. grouped = df.groupby(["category", "region"]).agg({"sales": "sum"})
                 group.
                                 Copied!
                                 Syntax:
                                   1. 1

    dataframe_name.head(n)

                 Displays the
                                 Copied!
                 first n rows of
head()
                 the
                                 Example:
                 DataFrame.
                                   1. 1
                                   1. df.head(5)
                                 Copied!
                                 Syntax:
                                   1. 1
                                   1. import pandas as pd
                 Imports the
                                 Copied!
                 Pandas library
Import pandas
                 with the alias
                                Example:
                 pd.
                                   1. import pandas as pd
                                 Copied!
info()
                 Provides
                                 Syntax:
                 information
                                   1. 1
                 about the
                 DataFrame,
                                   1. dataframe_name.info()
                 including data
                                  Copied!
```

```
types and
                                Example:
                 memory usage.
                                  1. 1
                                  1. df.info()
                                 Copied!
                                Syntax:
                                  1. 1
                                  1. merged_df = pd.merge(df1, df2, on=["column1", "column2"])
                 Merges two
                 DataFrames
                                Copied!
                 based on
merge()
                 multiple
                                Example:
                 common
                 columns.
                                  1. 1
                                  1. merged_df = pd.merge(sales, products, on=["product_id", "category_id"])
                                 Copied!
                                Syntax:
                                  1. 1

    print(df) # or just type df

                                 Copied!
                 Displays the
print DataFrame content of the Example:
                 DataFrame.
                                  1. 1
                                  2. 2

 print(df)

                                  2. df
                                 Copied!
                                Syntax:
                                  1. 1

    dataframe_name["column_name"].replace(old_value, new_value, inplace=True)

                 Replaces
                 specific values | Copied!
                 in a column
replace()
                                Example:
                 with new
                 values.
                                  1. 1
                                  1. df["status"].replace("In Progress", "Active", inplace=True)
                                 Copied!
                                Syntax:
                                  1. 1
                                  1. dataframe_name.tail(n)
                 Displays the
                                 Copied!
                 last n rows of
tail()
                 the
                                Example:
                 DataFrame.
                                  1. 1
                                  1. df.tail(5)
                                 Copied!
Numpy
 Package/Method
                          Description
                                                                   Syntax and Code Example
```

Imports the NumPy

library.

Syntax:

Importing NumPy

1. 1
 1. import numpy as np

Copied!

## Example:

- 1. 1
- 1. import numpy as np

#### Copied!

## Syntax:

- 1. 1
- 2. 2
- 1. array\_1d = np.array([list1 values]) # 1D Array
- 2. array\_2d = np.array([[list1 values], [list2 values]]) # 2D Array

### Copied!

np.array() Creates a one or multidimensional array,

Numpy Array

Attributes

## Example:

- 1. 1
- 2. 2
- 1. array\_1d = np.array([1, 2, 3]) # 1D Array
- 2.  $array_2d = np.array([[1, 2], [3, 4]]) # 2D Array$

#### Copied!

## Example:

- Calculates the mean of array elements
- Calculates the sum of array elements
- Finds the minimum value in the array
- Finds the maximum value in the array
- Computes dot product of two arrays
- 1. 1
- 2
   3
- 4. 4
- 5. 5
- np.mean(array)
- np.sum(array)
- np.min(array
- 4. np.max(array)
- 5. np.dot(array\_1, array\_2)
